

**Glarefiber Preinsulated Piping System**

Glarefiber is a preinsulated piping system designed for applications above ground, under piers, and in concrete trenches and tunnels. It utilizes mineral fiber insulation around the carrier pipe. The insulation is covered by an outside fiberglass jacket. Glarefiber offers short duration construction time as it is delivered to a job site with the insulation and outside jacket already installed. Users include military installations, public or private district heating systems, universities, refineries, and private owners of thermal distribution systems.
