

Precision Primavera Integrator

Precision Primavera Integrator is an interface that enables schedulers to build scheduling activities, resources and durations using up-to-the-minute electronically transferred estimating information. The integrator connects Timberline's Precision Estimating construction software with full capabilities of Primavera's Project Planner (R) (P3) and Primavision (TM). It provides direct feedback on how changes or assumptions impact the estimator's original budget. At any time the scheduler can instantly retrieve crew details, workpackages, material items, productivity factors and the estimator's notes and calculations.
