

**Septic Leachfield Form**

The Infiltrator™ is a plastic molded leaching chamber that replaces pipe and gravel in a septic leachfield. The specially designed arch shaped chamber is placed directly on the soil in the trench. It allows the size of the leachfield to be reduced by as much as 50 %. It provides an infiltrative surface without gravel masking, and a storage volume for peak flow situations. It can save up to two thirds of the labor usually required for leachfield installations.
