

The Simon Constructor Mobile Aerial Work Platform

The Simon Constructor is an aerial work platform with a uniquely designed boom. This innovation has the ability to reach up and over obstacles within awkward locations and confined areas. It is available in several working heights, and its standard four wheel drive makes it rugged enough for rough terrain, but versatile enough to work in confined areas and in awkward outdoor locations. It can reach places that conventional telescoping booms and scaffolding cannot. It is hydraulically controlled and travels in its stowed position at speeds up to 5 mph, but its travel speed with the boom elevated is automatically reduced for safety reasons. A large and standard size basket holds two workers.
