

Treated Lumber Nail

The Treated Lumber Nail is a power driven nail specifically designed for joining CCA pressure treated wood in outdoor applications. The nail is a patented design that incorporates a controlled chemistry steel. The first corrosion barrier is a quality zinc electroplate sealed with a quality yellow chromate. Over this is a high performance polymer overcoat baked onto the nail surface. The nail has many benefits. It offers very high corrosion protection, excellent lubricity which allows the use of light power tools, increased worker productivity, and superior holding power. The fastener also reduces the staining of redwood and cedar siding.
