

**Hazardous Communications – MSDS Computer Database System**

The Hazardous Communication/MSDS Computer Database System was designed to accommodate the record keeping requirements of OSHA Hazardous Communication Standard 29CFR 1926.59. It provides a user friendly computerized management program to help the job-site hazard communication coordinator to maintain a hazardous chemical inventory, to maintain first aid and emergency information, to account for material safety data sheets (MSDSs), to expand the capability to interact with other employers on a multi-employer site, and to track hazardous materials by location or storage area. A tool box script which can be read by the supervisor of the crew can be printed out using this powerful database program. The script describes the product in clear, understandable terms and designates the required personal protective equipment, including the type of respiratory protection, if required.
