

Quality Partnering for Design, Construction, and Accelerated Startup

Quality partnering achieved a unique working relationship that resulted in the successful design, construction, and accelerated startup of a 300 ton per day recycling plant producing high quality secondary fiber. This unique advancement beyond traditional partnership arrangements expands upon the Partners In Construction Cooperation (PICC). This initiative is innovative because of the way working relationships were conceived, developed, and maintained throughout the project and on into plant operations. Total Quality Management was used to integrate the various concepts and working relationships. The new system expanded upon and replaced older work methods.
