

Rub-R-Wall Waterproofing

Rub-R-Wall Waterproofing is a single component, asphalt free, all rubber polymer, waterproofing for below grade, sandwich slab, and other UV protected concrete, masonry, wood and foamed polystyrene surfaces. The membrane is cost effective, non-leachable, non-toxic, and sprayable. It will not contaminate ground water. Because of its high elongation and recovery rate it has unequaled crack bridging power. Rub-R-Wall use is restricted to Certified Applicators. It was invented by Mr. Charles Bolen and Mr. Michael G. Roberts in 1989 and is being used on new residential and commercial foundations and horizontal applications throughout the world.
