

Shoring Shield

Shoring Shield is a patented development in excavation safety systems that is marketed by the Speed Shore Corporation. It incorporates the benefits of aluminum hydraulic trench shoring with the security of a static shield. The Shoring Shield consists of six main parts which can be quickly assembled or disassembled in minutes by a crew of two. The main parts include two sidewalls of overlapping aluminum vertical sheeting bolted to two horizontal heavy-duty aluminum wales and four Speed StrutsSM, each made of telescoping steel sleeves which enclose an aluminum hydraulic cylinder and return spring. A patented hydraulic manifold enables the installer to control all cylinders from a single point. Pre-engineered end panels may be adapted to any Shoring Shield for three or four sided protection.
