

Single Unit, Multi Signal, Variable Plane Measuring and Leveling Device

This measuring and leveling device is a modern adaptation of the water level. The water level in the device is electronically sensed and provides a high level of accuracy. The device can be operated by one person. Other advantages include the ability to level over and around objects and the ability to level around circular objects without multiple setups. The instrument can be used in many applications in carpentry, excavation, equipment installation, ceiling installation, and tile setting piping installation.
