

Concrete Wall and Roof Panel System

The Corotherm tilt-up concrete wall or roof panel is a patented, structural, insulated, site-cast or precast system that has been used by contractors, under license from Corotherm, since 1991. It is a single pour of concrete over a specially formed EPS insulating mold that has an interior wall liner already laminated to it. The insulation is factory grooved to create concrete ribs that provide high strength without adding useless weight. The panel can be made stronger by increasing mold thickness, which makes deeper, stronger ribs and provides additional insulation.
