

Dudley Rake Levels Granular Bases of Sidewalks

The Dudley Rake is used for accurate leveling of granular bases of sidewalks to obtain uniform sidewalk thickness. It is made of a thin steel plate attached to a wood hoe-like handle. The plate is as wide as a concrete walk, and its edge is deeply serrated. When drawn across the gravel over the length of a walk, the Dudley Rake produces the proper level for the gravel. Designed with simplicity in mind, it is easily produced and used. It can be applied to base preparations for a majority of slabs. It reduces manpower, time, and subbase material. The Dudley Rake also allows more accurate estimates and purchases of concrete quantities.
