

Somero Mobile Laser Controlled Screed

The Mobile Laser Controlled Screed is a laser controlled concrete screed machine that establishes grades by laser, disperses concrete by auger, and vibrates and consolidates the concrete. Its built-in computer monitors the laser beam and adjusts screed elevation 5 times per second. It features a 12' wide screeding head mounted on a 20' telescopic boom, a mobile 4-wheel drive, and a 4-wheel steering unit with 360 degree rotation. This Laser Screed originated in New Hampshire in 1985, and over 100 units have been sold to date. It has been used on 400 million square feet of slabs-on-grade in twelve countries.
