

S A F E (Steel and Foam Engineered) Basement

The S.A.F.E. basement is a system designed to replace concrete in residential basement construction. The S.A.F.E. basement offers a 25-year guarantee against leakage. It features vertical steel frame members to provide structural strength to the foundation wall, polyisocyanurate (closed cell) foam to insulate and prevent moisture, and a patented foundation system. The S.A.F.E. basement also has a built in drainage system that diverts any water in the basement wall cavity to the sump pump, which eliminates leakage to the basement.
