

Dry Utility (Gas, Electric, Telephone, and CATV) Design Engineering

This innovation is Professional Consulting Group's (PCG) ability to resolve costly utility related issues. These issues, through design, include new service installations, overhead to underground conversions, existing facility relocations, and utility assessment districts. PCG designs dry utility systems (electric, cable television, gas and telephone) which are readily accepted by dry utility companies. PCG's designs replace those normally developed by local public utility companies for public and private sector building and improvement projects. In its designs, PCG applies its understanding of utility system design, service rules, construction standards, local public agency ordinances, and building industry developments.
