

Siltmaster and Spoilsaver Install Silt Fences

The Siltmaster and Spoilsaver are attachments used on the bucket of a front end loader to silt fences on construction sites. The Siltmaster digs a uniformly deep trench for the silt fence, and enables the operator to install approximately 500 feet of silt fence per hour. The Spoilsaver is primarily designed for backfilling the silt fence after the fabric is installed. Backfilling silt fence is critical to the proper operation of the fence. These attachments may be put on the buckets of larger equipment if needed, and have a number of advantages including: a constant furrow depth which conforms to regulations, excellent operator visibility, light weight and easy transportability, inexpensive, easy of attachment to equipment, and rapid cost payback. Siltmaster and Spoilsaver will help protect the environment by allowing the proper installation of silt fence in a timely, cost effective method.
