

**Somero Laser Screed**

The Somero Laser Screed is a highly maneuverable ride-on machine to screed concrete being placed for high quality floors needed in industrial and warehouse facilities. It is capable of striking off low-slump freshly placed concrete to a degree of levelness that surpasses old methods. The screed establishes grade by laser, disperses concrete by auger, vibrates and consolidates the concrete. The console mounted computer maintains grade by monitoring the laser and adjusting the concrete screed elevation five times per second. The Somero Laser Screed decreases labor costs, placement time, construction joints, and pipe and wet screed methods; while increasing accuracy, productivity, and customer satisfaction. The screed routinely meets specifications for flatness and levelness of FL 45 or better and some customers have installed floors with F-numbers higher than 100.
